短眠マウスで探る睡眠の必要性

私たちは一生の約3分の1を眠って過ごします。しかしながらなぜ睡眠が必要なのか、またなぜ眠らざるといられないのかは明らかではありません。これらの疑問に答えるだけでなく、良質な社会生活を目指すためにも、睡眠の必要性や制御の研究は重要です。我々は最近、睡眠量が極端に少ないマウスを偶然創り出しました。驚いたことに、このマウスでは眠気マーカーの増大が見られません。つまり、過度な眠気を呈さずに少ない睡眠量で活動可能な、いわゆるショートスリーパーのようなマウスと言えます。我々は、これらの“短眠”モデルを用いて、短眠が生体に与える影響を明らかにし、睡眠の必要性の理解を目指します。その一方で、短眠が作られる仕組みを研究し、睡眠制御メカニズム解明に挑みます。当研究室はラザルス准教授との共同主宰となります。研究内容に興味のある学生の参加を歓迎します。

To elucidate the necessity of sleep with short-sleeping mice

People spend approximately one-third of their life sleeping. Why sleep is compulsory for human life and cannot be avoided, however, remains unclear. It is important to understand why sleep is necessary and how sleep is controlled – not only to elucidate physiological behavior but also to enhance our quality of life.

Recently, we inadvertently created mice that require an extremely low amount of sleep. Surprisingly, these mice do not show an increase in a sleepiness marker. Therefore, the behavior is very similar to that of so-called “short sleepers” – people that can function for long periods of time on little sleep without exhibiting excessive sleepiness. Using multiple “short sleep” models, including this novel mouse model, we study the effect of short sleep on other physiologic functions in the body to understand the necessity of sleep. We also study the neural mechanisms of short sleep to clarify the control mechanisms of sleep.
